Low-impact development

From Wikipedia, the free encyclopedia

(Redirected from [Low impact development](#))

Low-impact development (LID) may refer to:

- **Low-impact development (Canada/US)**, the term is used in Canada and the United States to describe a land planning and engineering design approach to managing stormwater runoff.
- **Low-impact development (UK)**, the term is used in the UK for a type of development which through its low negative environmental impact either enhances or does not significantly diminish environmental quality.

lid (li d)

1. A removable or hinged cover for a hollow receptacle or box.
2. An eyelid.
3. Biology. A flaplike covering, such as an operculum.
4. A curb, restraint, or limit: *approved a new lid on corporate spending.*
5. Informal. An act of concealment; a cover: "*Put a lid on it!*"
6. Slang. A hat.
7. Slang. An ounce of a certain noxious weed.

Low-Impact Development: An Integrated Environmental Design Approach

“Match Predevelopment Curve Number”

Low-Impact Development Design Strategies
An Integrated Design Approach

Prepared by:
Prince George's
County, Maryland
Department of
Environmental
Resources
Programs and
Planning Division
June 1999

- Site Planning
- Hydrology
- Distributed IMP Technologies
- Erosion and Sediment Control
- Public Outreach

This requirement is identical to the State of Maryland's definition of the predevelopment condition. The CN for the predevelopment condition is to be determined based on the land cover being woods in good condition and the existing HSG. The design storm is to be the greater of the rainfall at which direct runoff begins from a woods in good condition, with a modifying factor, or the 1-year 24-hour storm event. The rainfall at which direct runoff begins is determined using Equation A.9. The initial rainfall amount at which direct runoff begins from a woodland is modified by multiplying this amount by a factor of 1.5 to account for the slower runoff release rate under the wooded predevelopment condition.

$$P = 0.2 \times \left(\frac{1000}{CN_c} - 10 \right) \quad \text{Eq. A.9}$$

where P is rainfall at which direct runoff begins.

Minimal Impact Design Standards

New State Legislation

*(c) The agency shall develop **performance standards, design standards**, or other **tools** to enable and promote the implementation of **low-impact development** and other stormwater management techniques. For the purposes of this section, "low-impact development" means an approach to storm water management that **mimics a site's natural hydrology** as the landscape is developed. Using the low-impact development approach, storm water is managed on-site and the **rate and volume of predevelopment storm water reaching receiving waters is unchanged**. The calculation of predevelopment hydrology is based on **native soil and vegetation**.*

- *Minnesota Statutes 2009, section 115.03, subdivision 5c*

Performance Goal

Dennis O'Hara – Northernimages.com

Minimal Impact Design Standards

New development

For new, nonlinear developments that create more than one acre of new impervious surface on sites without restrictions, stormwater runoff volumes will be controlled and the post-construction runoff volume shall be retained on site for 1.1 inches of runoff from impervious surfaces statewide.

Minimal Impact Design Standards

Redevelopment

Nonlinear redevelopment projects on sites without restrictions that create one or more acres of new and/or fully reconstructed impervious surfaces shall capture and retain on site 1.1 inches of runoff from the new and/or fully reconstructed impervious surfaces.

Definition: Any development that is not considered new development.

Minimal Impact Design Standards

Linear Projects

Linear projects on sites without restrictions that create one acre or greater of new and/or fully reconstructed impervious surface, shall capture and retain the larger of the following:

- ☐ 0.55 inches of runoff from the new and fully reconstructed impervious surfaces
- ☐ 1.1 inches of runoff from the net increase in impervious area

Mill and overlay and other resurfacing activities are not considered fully reconstructed.

Definition: Construction or reconstruction of roads, trails, sidewalks, and rail lines that are not part of a common plan of development or sale.

GRADING NOTES:

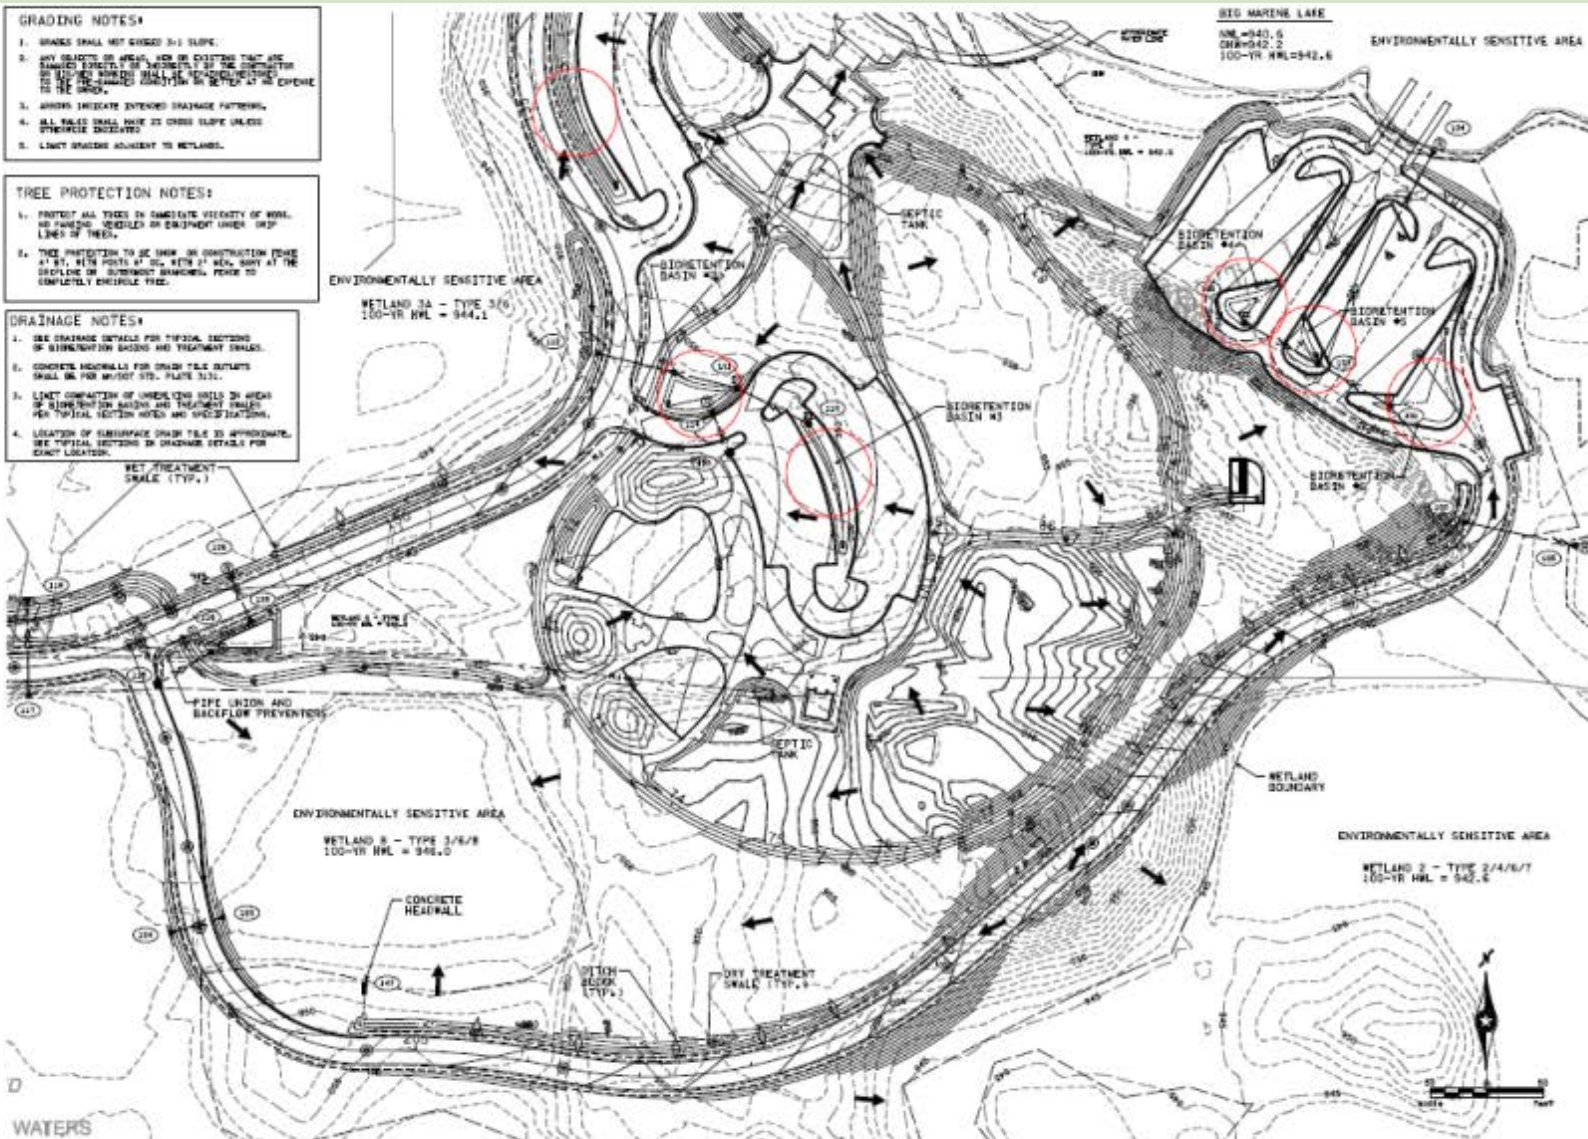

1. GRADES SHALL NOT EXCEED 3:1 SLOPE.
2. ANY GRADING OR AREAS ARE IN EXISTENCE THAT ARE SHOWN EXISTING IN THE EXISTING MAP SHALL BE MAINTAINED TO THE EXISTING CONDITION UNLESS AT AN EXPENSE TO THE DISTRICT.
3. AREAS INDICATE EXTENDED DRAINAGE PATTERNS.
4. ALL PAVED SHALL HAVE 2% CROSS SLOPE UNLESS OTHERWISE INDICATED.
5. LIMIT GRADING ADJACENT TO WETLANDS.

TREE PROTECTION NOTES:

1. PROTECT ALL TREES IN IMMEDIATE VICINITY OF WORK. NO FUELING, STORAGE OR EQUIPMENT UNDER DROP LINES OF TREES.
2. TREE PROTECTION TO BE DONE ON CONSTRUCTION PERIOD AT 8:1 WITH POSTS AT 10' WITH 2" NEW, BURY AT THE DROPOFF OR SUBSEQUENT BRANCHING, PERIOD TO COMPLETELY EXHAUSTED TREE.

DRAINAGE NOTES:

1. USE GRADE DETAILS FOR TYPICAL SECTIONS OF DRAINAGE BASINS AND TREATMENT SWALES.
2. CONCRETE HEADWALLS FOR DRAIN TIE OUTLETS SHALL BE FOR APPROX. 10'x10'x10'.
3. LIMIT GRADING OF UNDERLYING AREAS IN AREAS OF DRAINAGE BASINS AND TREATMENT SWALES PER TYPICAL SECTION NOTES AND SPECIFICATIONS.
4. LOCATION OF SURFACE DRAIN TIE IS APPROPRIATE. SEE TYPICAL SECTION FOR DRAINAGE DETAILS FOR EXACT LOCATION.

FREE RAINGARDENS

For select LILY LAKE residents

□ — Fall 2012 GROUND-BREAKING

What Happens When It Rains?

In your neighborhood, rain that runs off of rooftops, driveways and streets goes into storm sewers that flow directly into Lily Lake without getting cleaned. Water from Lily Lake eventually goes to the St. Croix River.

Rain runoff can wash oils, fertilizers, pesticides, and dirt straight into Lily Lake.

A raingarden in your yard will soak runoff into the ground before the water can carry these pollutants down the road and into Lily Lake.

About the Funds

Legacy Funds

In 2008, Minnesota's voters passed the Clean Water, Land and Legacy Amendment (Legacy Amendment) to the Minnesota Constitution to: protect drinking water sources; to protect, enhance, and restore wetlands, prairies, forests, and fish, game, and wildlife habitat; to preserve arts and cultural heritage; to support parks and trails; and to protect, enhance, and restore lakes, rivers, streams, and groundwater.

The Legacy Amendment increases the state sales tax by three-eighths of one percent beginning on July 1, 2009 and continuing until 2034. The additional sales tax revenue is distributed into four funds as follows: 33 percent to the clean water fund; 33 percent to the outdoor heritage fund; 19.75 percent to the arts and cultural heritage fund; and 14.25 percent to the parks and trails fund.

Environment and Natural Resources Trust Fund

In 1988, Minnesota's voters approved a constitutional amendment establishing the Environment and Natural Resources Trust Fund

Project Narrative

Lily Lake, in Stillwater, is a popular recreational spot for residents with its swimming beach, fishing pier, and canoe/boat access. Lily Lake is impaired by excess nutrients, and restoring its water quality is a priority for the community. A recent assessment of the 22 catchments, or 590 acres, that drain to Lily Lake identified multiple locations where stormwater management features could be installed to help achieve the 145-pound phosphorus load reduction that is needed to help improve water quality.

The purpose of this project was to work with residents in two of the 22 catchments, located on the northeast side of Lily Lake. The MSCWMO kicked off the project by sending colorful flyers to all residents living within the two priority catchments. The flyer invited residents to an open house where they were educated about the current state of Lily Lake and what could and was being done to improve water quality. Of the forty residents to who signed up to work with the MSCWMO to install stormwater treatment features on their property, the top 15 locations were selected based on the sites ability to capture pollutants prior to reaching Lily Lake. The 15 selected residents worked with the MSCWMO to design their stormwater treatment feature and agreed to maintain the feature for up to ten years.

Actual Outcomes

A total of 15 raingardens resulting in 3000 square feet of treatment facilities were installed in the two target catchments as part of this project. According to as-built modeling information, the project resulted in the expected 9.5 lb/yr TP reduction.

Map shows land area included in the recently completed Lily Lake sub-watershed assessment. Catchments Lily-02 and Lily-03 on the northeast side of the lake were the focus of this project.

One of the recently completed raingardens that captures runoff prior to its discharge into Lily Lake.

Notice the curb cut which allows runoff off of the street and into the raingarden to filter the runoff before it reaches Lily Lake.

The 2013 International Low Impact Development (LID) Symposium is being hosted in the Midwestern United States through a collaborative effort between many states, universities, and organizations. From the Great Lakes to the Mississippi Watershed, every state in the Midwestern United States is addressing urban water quality issues from combined sewer overflows to stormwater runoff. The 2013 International LID Symposium will bring together over 1,000 professionals to share their research, implementation, policy, financing, and education strategies to build and restore cities while protecting our environment.
