# THE INFLUENCE OF LANDSCAPE ON URBAN BUMBLE BEE FORAGING

Vera Pfeiffer

Postdoc in the Crowder Lab  
at Washington State University

# TWO URBAN BEE DISSERTATION CHAPTERS

Influence of land cover and land use history  
on urban bee communities (Madison, WI)

The buzz in the city: the influence of urban  
floral resources on the distribution of foraging  
bumble bees

# LAND COVER AND LAND USE HISTORY INFLUENCE URBAN BEE COMMUNITIES

# URBAN BEE DIVERSITY

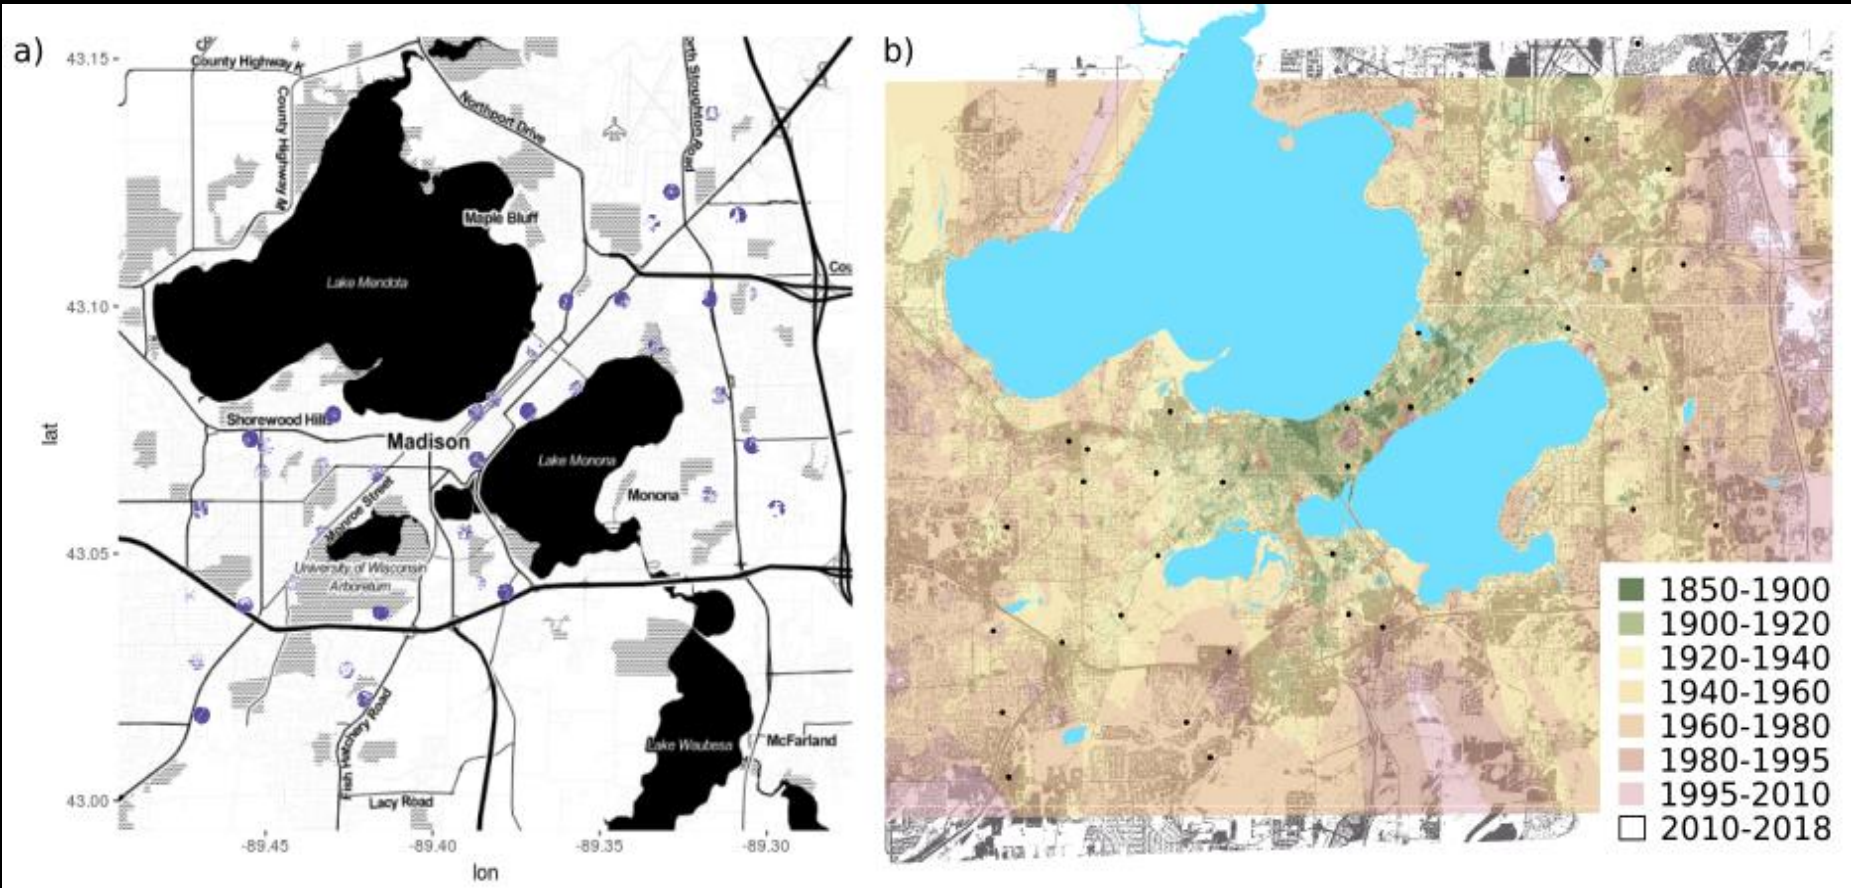

URBAN BEES

BUMBLE BEE SURVEY

METHODS

RESULTS

# URBAN BEE COMMUNITIES

# BEE RICHNESS

## Model summary

F-stat: 2.73	Rsqu: 0.14	p: 0.08
Factors	Estimate	p-value
Intercept	27.05	0.00 ***
Natural Veg (1000m)	3.71	0.14
Impervious (% , 200m)	4.29	0.09 .

## All bees

# URBAN BEE GUILDS

**Soil nesters:**  
Sweat bees  
Mining bees

**Underground  
cavity nesters:**  
Bumble bees

**Above ground  
nesters:**  
Mason bees  
Leaf cutting bees

# THE BUZZ IN THE CITY: THE INFLUENCE OF FLORAL RESOURCES ON BUMBLE BEE FORAGING

# FLORAL RESOURCE HETEROGENEITY

FLORAL RESOURCES AND BEES

METHODS

RESULTS

# RESEARCH HYPOTHESES

H1) Increased *flower cover* and *density* as well as *species richness* and especially *prairie/lawn species richness* increase the number of foraging bumble bees

H2) The *influence of floral resource variables* *exhibit non-stationarity*, *differing* across the study extent due to local floral resource diversity and distribution

# STUDY EXTENT

Madison, WI, USA

400m x 400m blocks

# TRANSECT FLORAL DATA

Flower Cover

Flower Density

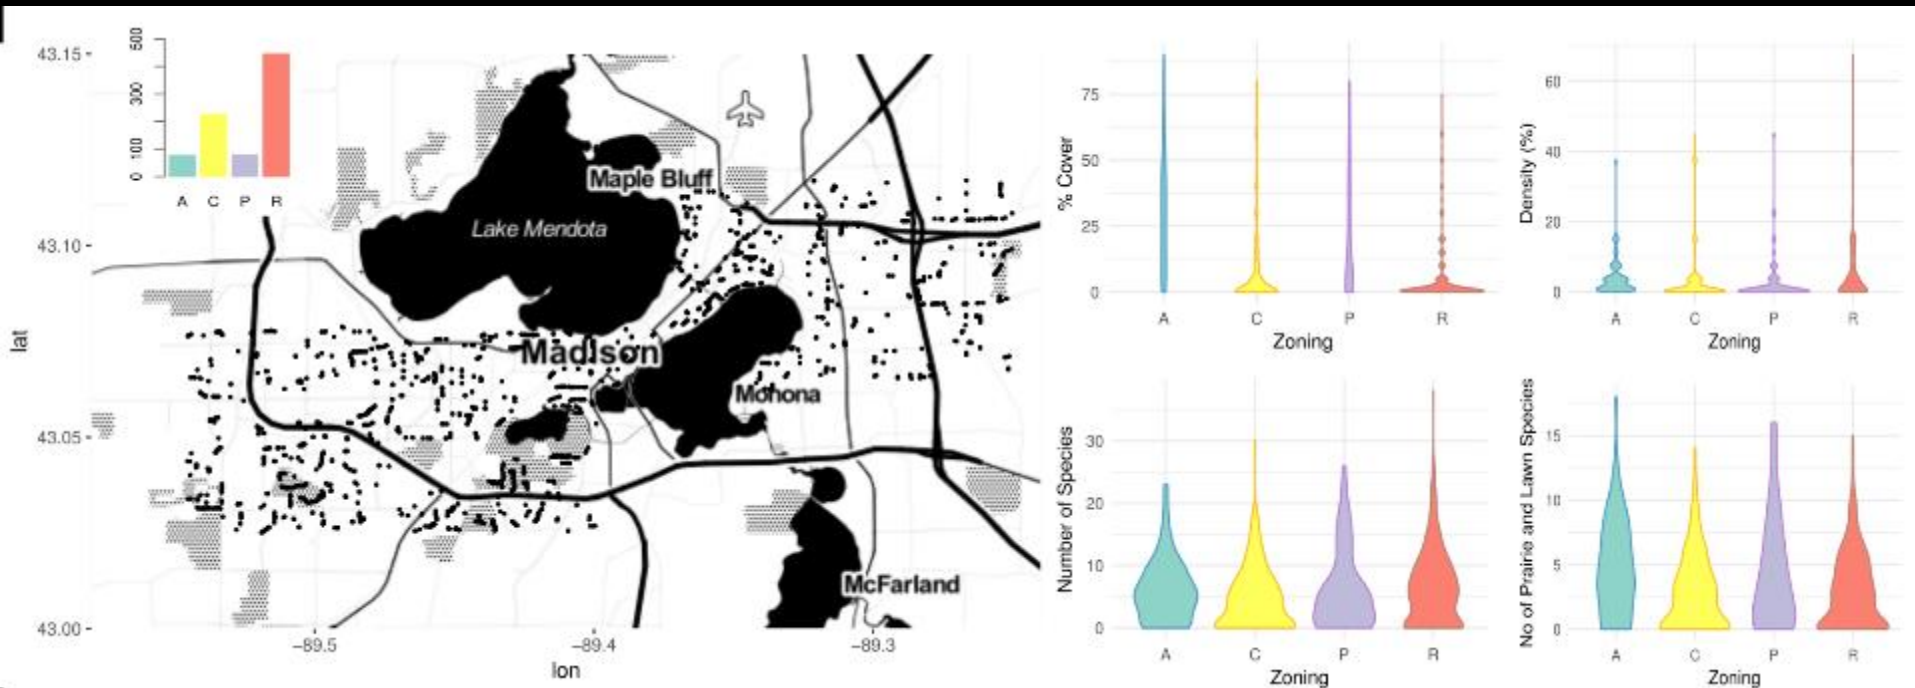

Flowering plant morphospecies richness

Prairie, lawn, garden species type

# FLORAL VARIABLES

# GLOBAL MODEL

## Quasipoisson GLM model

### Model summary

Factors	Estimate	Robust error	p-value
Intercept	0.330	0.225	0.194
Cover	0.016	0.003	0.000 ***
Species	0.042	0.011	0.000 ***
Wildflowers	0.037	0.023	0.073 .
Commercial	0.755	0.222	0.004 **
Park	1.463	0.251	0.000 ***
Residential	0.628	0.223	0.015 *

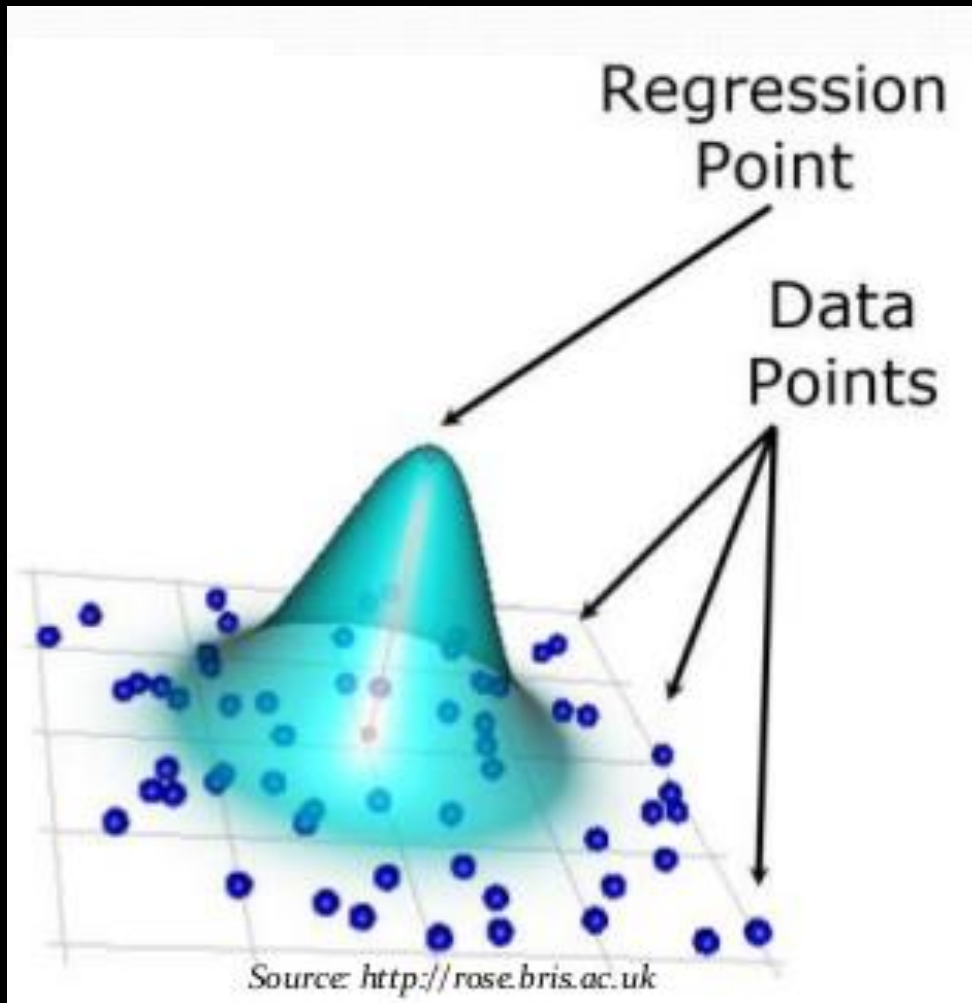

Null deviance: 12821.6 on 783 degrees of freedom

Residual deviance: 9085.1 on 777 degrees of freedom

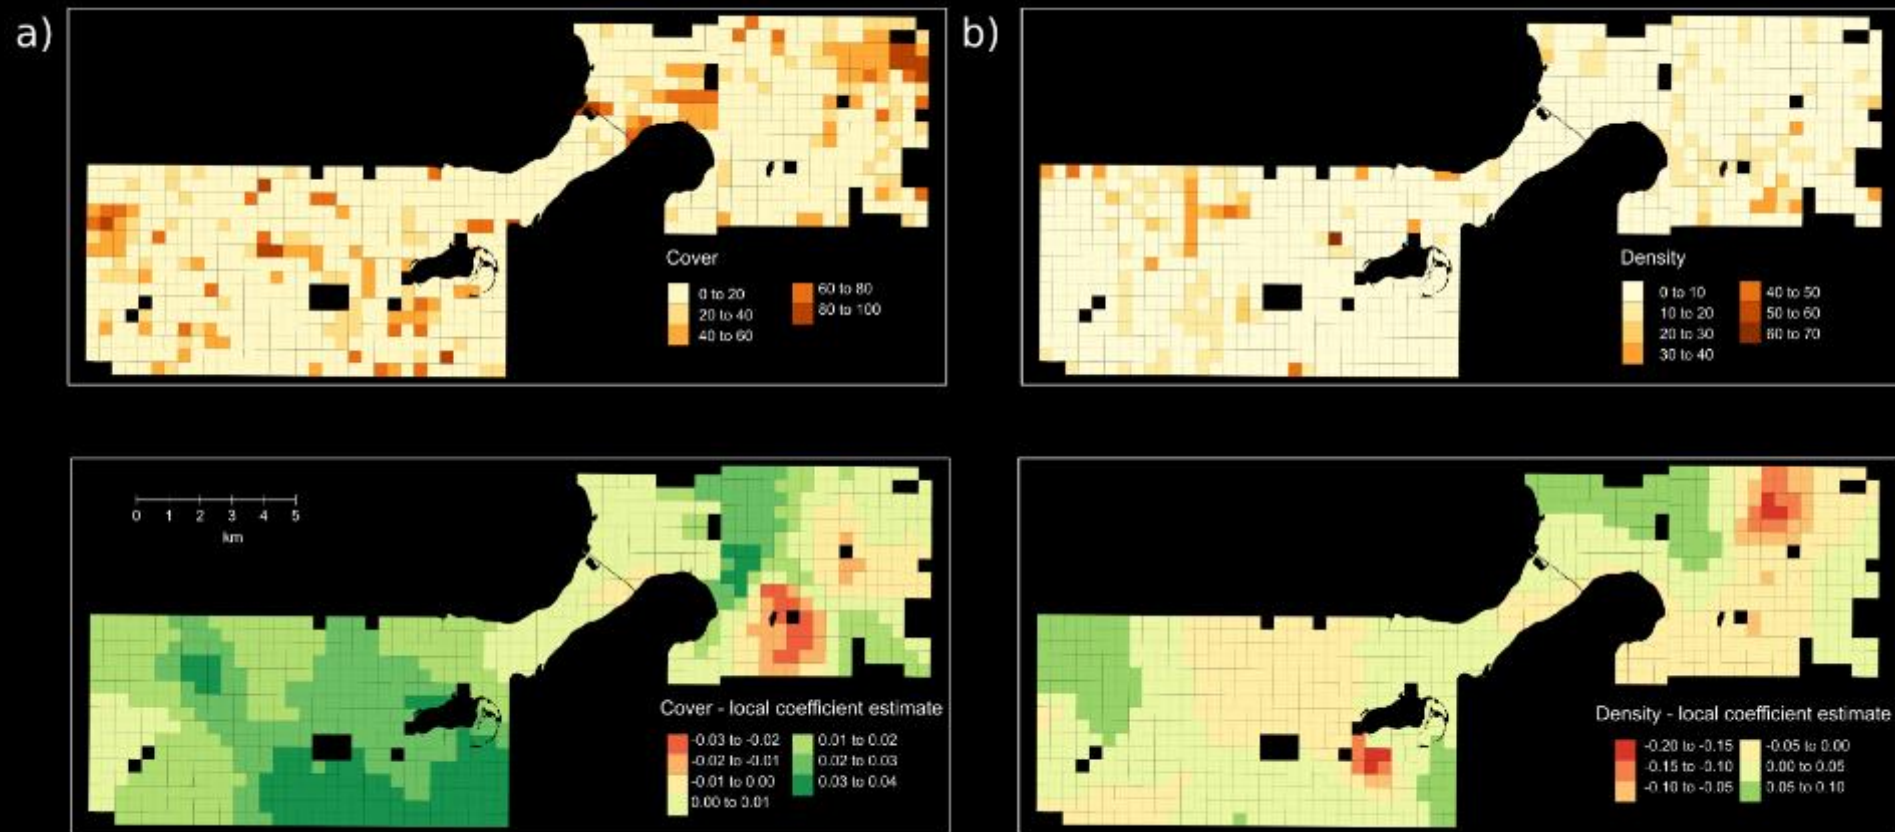

# GEOGRAPHICALLY WEIGHTED REGRESSION

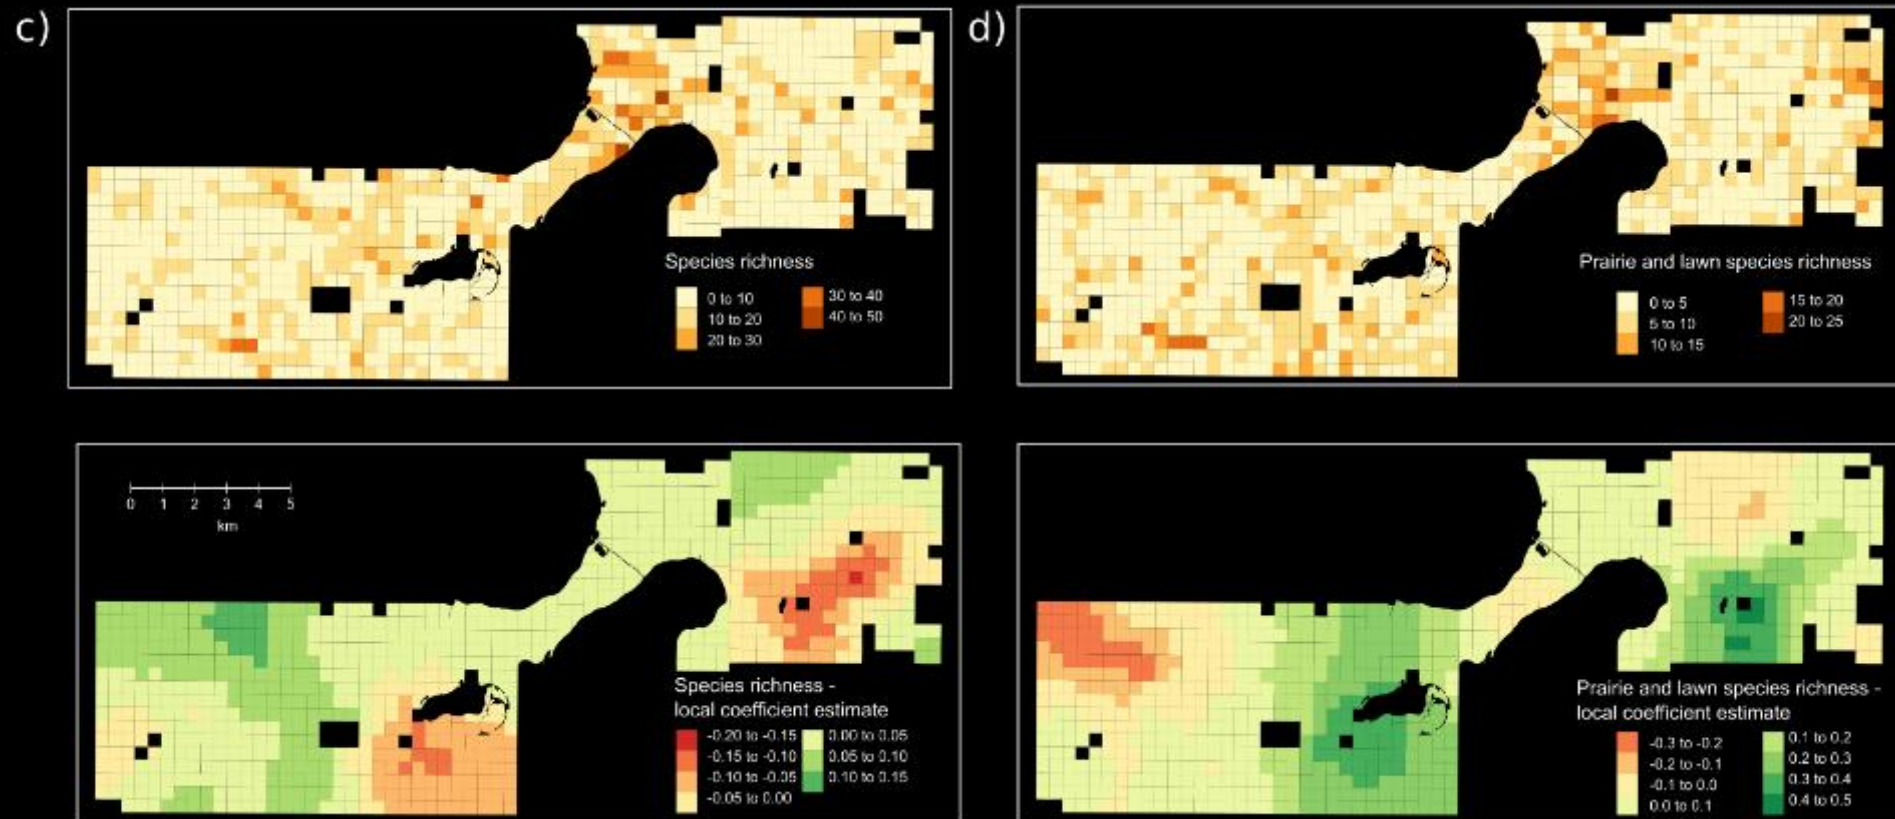

- Type of local regression
- Exploratory method to investigate non-stationarity in fixed effects

# GEOGRAPHICALLY WEIGHTED REGRESSION

# GEOGRAPHICALLY WEIGHTED REGRESSION

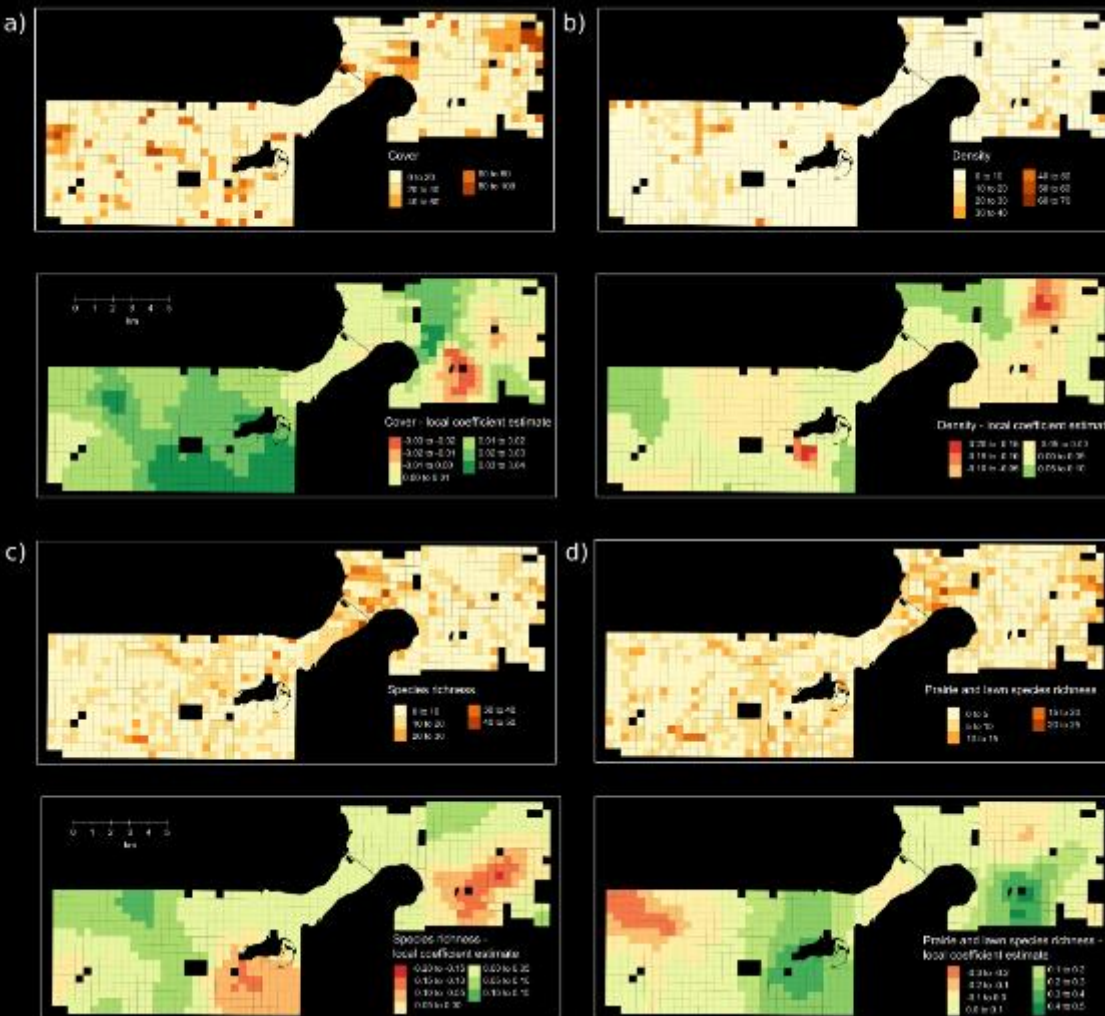

# SUMMARY

H1) *Flower cover, species richness* and especially *prairie/lawn species richness* increased the number of foraging bumble bees

H2) The influence of floral resource variables differ across the extent. Floral cover is the most pervasively strong influence, but the influence of native species richness stands out in large restored prairies nested in residential zones

# 14 FAVORITE FLOWERS

ACHIEVING OVER 1% OF BEE VISITS (70% TOTAL)

goldenrod (12.4%)  
*Solidago spp.*

white clover (12.2%)  
*Trifolium repens*

thistle (11.2%)  
*Cirsium spp.*

bee balm (10.4%)  
*Monarda spp.*

garden mints (5.6%)  
*Mentha spp.*

spirea (5.5%)  
*Spirea spp.*

purple coneflower (4.0%)  
*Echinacea purpurea*

silphiums (*Silphium spp.*), Russian sage (*Perovskia atriplicifolia*), Birds-foot trefoil (*Lotus corniculatus*), knapweed (*Centaurea spp.*), crown vetch (*Secuigera varia*), joe pye weed (*Eutrochium purpureum*), and red clover (*Trifolium pretense*), comprised between 1-3% of visits

# ACKNOWLEDGEMENTS

Special thanks to my Advisor and PhD committee: **Janet Silbernagel**, Juan Zalapa, Claudio Gratton, Sean Schoville, and Jun Zhu as well as other mentors

My lab mates through my PhD: Margaret Theiru, Emmanuel Santa-Martinez, Danny Minahan, Jessica Price, Hannah Larson, Sulong Zhou, Lindsey Tiegs and others

Funders: USDA as well as the NSF and IIASA for support to participate in the YSSP, and Fulbright to work at Mendel University in Brno, CZ
